

DECO3850 Final Deliverable 2: Slide

Weight: 15%

Deadline: Exam Week 2, 16 June, 15:00

Submission: submit to Blackboard

Deliverable:

For your final submission, we would like you to write a short paper about your project. This paper should set out your idea, clearly define its contribution (novelty, validity, and significance), discuss related work (including how that helped to inspire your project), provide a technical description of how your prototype works, describe how you evaluated your prototype (either through user testing or a technical evaluation), and reflecting on what you have achieved and learned (what has your project revealed about the future of work, is your project important, does it manage to say something meaningful, what should be done next?)

Your paper should include figures and references, and should be no longer than 4 pages (not including references), in the ACM conference proceedings format.

We recommend that you use Overleaf for writing this paper, but templates are available for Word, too.

Your writing should be your own and the use of AI for text generation is not allowed in this assignment. You are, however, welcome to use Grammarly and spell check. You should think carefully about what you write. You should be clear and succinct. You should use strong verbs and short sentences. You should never use a big word, when a small word will do.

I recommend watching this video about writing:

<https://www.youtube.com/watch?v=aZp4vZccl6Q&t=559s>

You should also consider getting *Elements of Style* by Strunk and White from the library. This is not a perfect book, but it does help you realise the level of thought that should go into every word.

Grading:

Grading will be qualitative and holistic. It will be negotiated across the whole teaching team. You will be graded across the following criteria:

Presentation (out of 3):

- Clarity
- Quality
- Use of Figures

Content (out of 12) -- (the communication of):

- Novelty – how is your idea new and what have you gained from related work?
- Validity – how does what you built illustrate your novelty?
- Significance – why build it? How is it meaningful?
- Reproducibility – Could others reproduce your work?
- Discussion – what have you learned?
- Evaluation – to what extent was your work a success?
